

UI Testing Checklist (Standard set applicable for most websites/ applications/ tech products)

Verify the positioning, length, size, alignment, and width of all UI elements.

Verify data entry in fields for numbers, text, special characters, and invalid characters.

Verify software functionality execution.

Verify data type errors.

Verify navigation elements in headers.

Verify table scrolling.

Verify progress bars.

Verify shortcuts and menu items.

Verify action buttons.

Verify the size, height, and width of elements.

Check the error messages that are displayed.

Try out various parts of the screen.

Check to see if the font is easy to read.

Test the screen in different resolutions by zooming in and out.

Check to see if the text and other parts of the page, such as icons and buttons, are in the right place.

Check the font colors.

Check to see if the images are clear.

Ensure that the images are in the correct position.

Check for spelling mistakes.

Ensure that users do not get frustrated when using the system's interface (User flow and mean time per customer journey)

Assess whether the interface looks good or not.

Check the scroll bars based on the size of the page, if there is one.

Test any fields that have been disabled.

Test how large the images are.

Check to see if the headings are in the correct position.

Test the color of the links.

Test UI elements such as buttons, text boxes, text areas, radio buttons, check boxes, drop-down menus, links, etc.
